# THE MAJOR DRIVERS OF GALAXY EVOLUTION

Haines+2007

## NATURE VS NURTURE

Peng+2010

## **OBSERVATIONAL STUDIES IN GALAXY EVOLUTION REQUIRE**

- Sizeable galaxy samples, exploiting different redshifts.
- Photometric and spectroscopic data.
- Homogeneous estimates of observed and rest-frame galaxy colours, stellar masses and spectral features.
- Consistent definition of the environment.

## The ultimate XMM extragalactic survey

Pierre+2016, <http://irfu.cea.fr/xxl>

*die Kunst*

*über*

*in der Wissenschaft*

### WHAT:

~622 XMM pointings covering a total area of ~ 50 deg<sup>2</sup> (N+S Fields) reaching a sensitivity of ~  $5 \times 10^{-15}$  erg s<sup>-1</sup> cm<sup>-2</sup> in the [0.5-2] keV band for point sources.

### WHY:

- Wide area in the sky → diminishing the cosmic variance.
- Groups and clusters (G&C) confirmed spectroscopically.
- $2.27 \times 10^{41} \leq L_{500}^{\text{XXL}} \text{ (erg sec}^{-1}\text{)} \leq 3.18 \times 10^{44}$ .
- $1.24 \times 10^{13} \leq M_{500} (M_{\odot}) \leq 6.64 \times 10^{14}$ .

### THIS WORK:

**132 XXL-N G&C  $M_{500}$ ,  $R_{500}$ ,  $L_{\text{X-ray}}$ ,  $T_{\text{X-ray}}$  both from direct measurements and scaling relations.**

+

**Unprecedented combination of information on the G&C intergalactic gas (X) with galaxy photometry and spectroscopy.**

## **GOAL:**

Investigate the properties of galaxies at intermediate redshift ( $0.1 \leq z \leq 0.6$ ) and assess the role of environment on the galaxy stellar mass assembly and star formation activity.

**1)** Build and characterize the **spectrophotometric sample** of galaxies

**2)** The **Galaxy stellar mass function (GSMF)** in different environments and at different redshifts

**3)** Zooming in a **supercluster @z=0.3**: Stellar population properties and star formation activity

**4)** The **star forming fractions and SFR-mass relation** from **z=0.1 up to z=0.5**.

## **GOAL:**

Investigate the properties of galaxies at intermediate redshift ( $0.1 \leq z \leq 0.6$ ) and assess the role of environment on the galaxy stellar mass assembly and star formation activity.

**1) Build and characterize the **spectrophotometric sample** of galaxies**

2) The **Galaxy stellar mass function (GSMF)** in different environments and at different redshifts

3) Zooming in a **supercluster @z=0.3**: Stellar population properties and star formation activity

4) The **star forming fractions and SFR-mass relation** from **z=0.1 up to z=0.5**.

# XXL PAPER XXII: A COMPLETE CHARACTERIZATION OF XXL-N GALAXIES

Guglielmo+2017.

The catalogue is going to be released at CDS

24336 galaxies

✓  $z \leq 0.6$

✓ Group membership:

22111 (29683) in the field.

2225 (3446) 3  $r_{200}$  members.

✓ Photometry from CFHTLS-W1 field:  $u^*, g', r', i', z'$ .

✓ Completeness weight and magnitude limit  $r \leq 20.0$

✓ Stellar Masses and Absolute Magnitudes from LePhare (95.5%)

## **GOAL:**

Investigate the properties of galaxies at intermediate redshift ( $0.1 \leq z \leq 0.6$ ) and assess the role of environment on the galaxy stellar mass assembly and star formation activity.

1) Build and characterize the **spectrophotometric sample** of galaxies

2) The **Galaxy stellar mass function (GSMF)** in different environments and at different redshifts

3) Zooming in a **supercluster @ $z=0.3$** : Stellar population properties and star formation activity

4) The **star forming fractions and SFR-mass relation** from  $z=0.1$  up to  $z=0.5$ .

## GOAL:

Investigate the properties of galaxies at intermediate redshift ( $0.1 \leq z \leq 0.6$ ) and assess the role of environment on the galaxy stellar mass assembly and star formation activity.

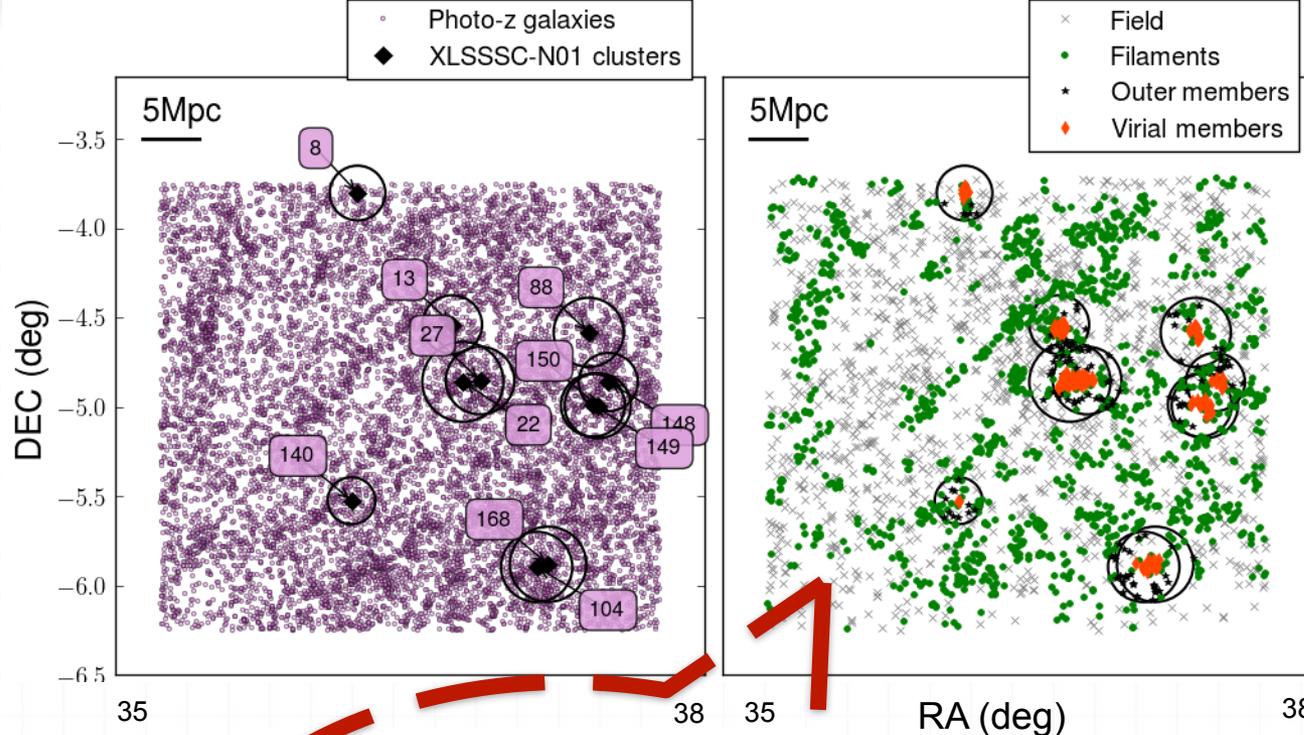

1) Build and characterize the **spectrophotometric sample** of galaxies

2) The **Galaxy stellar mass function (GSMF)** in different environments and at different redshifts

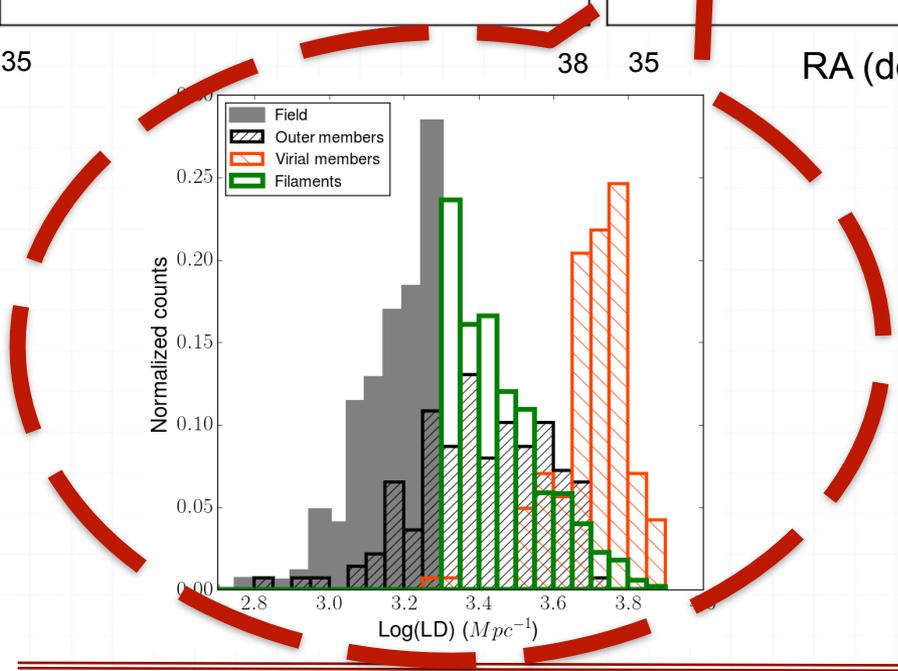

3) Zooming in a **supercluster @z=0.3**: Stellar population properties and star formation activity

4) The **star forming fractions and SFR-mass relation** from  $z=0.1$  up to  $z=0.5$ .

# THE XLSS<sub>s</sub>C N01 SUPERCLUSTER

+2008, Santos+2013

Similar trends using rest-frame colours

# The sSFR-Mass relation shows no dependence on environment In XLSSsC N01 supercluster

# The LWage-Mass relation in different environments In XLSSsC N01 supercluster

## **GOAL:**

Investigate the properties of galaxies at intermediate redshift ( $0.1 \leq z \leq 0.6$ ) and assess the role of environment on the galaxy stellar mass assembly and star formation activity.

1) Build and characterize the **spectrophotometric sample** of galaxies

2) The **Galaxy stellar mass function (GSMF)** in different environments and at different redshifts

3) Zooming in a **supercluster @ $z=0.3$** : Stellar population properties and star formation activity

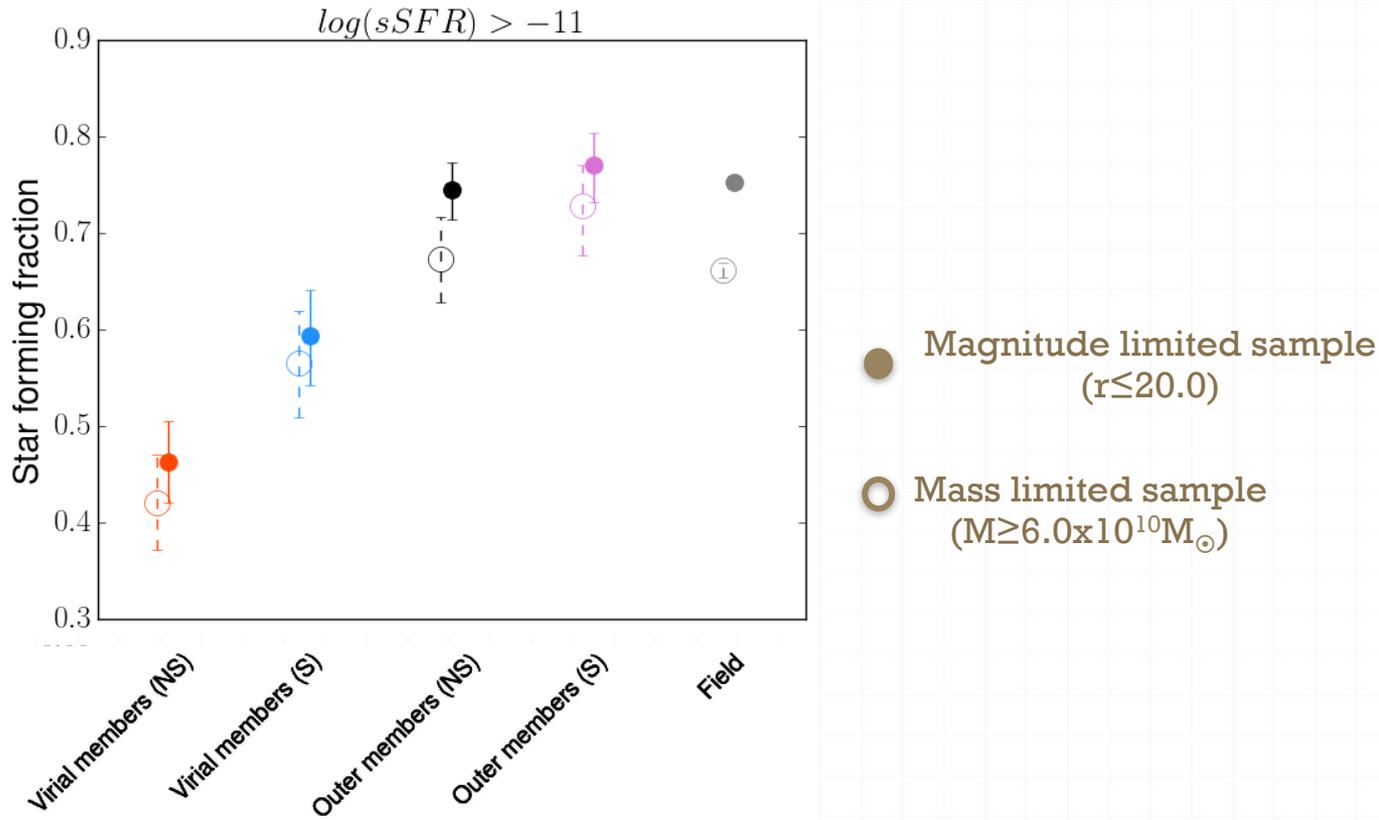

4) The **star forming fractions and SFR-mass relation** from  **$z=0.1$  up to  $z=0.5$** .

## GOAL:

Investigate the properties of galaxies at intermediate redshift ( $0.1 \leq z \leq 0.6$ ) and assess the role of environment on the galaxy stellar mass assembly and star formation activity.

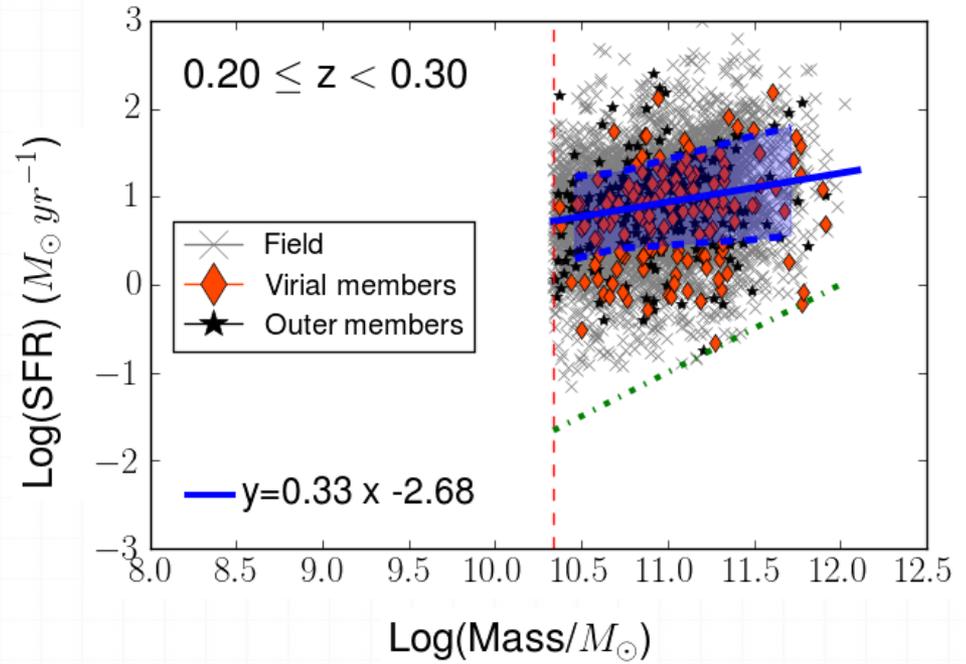

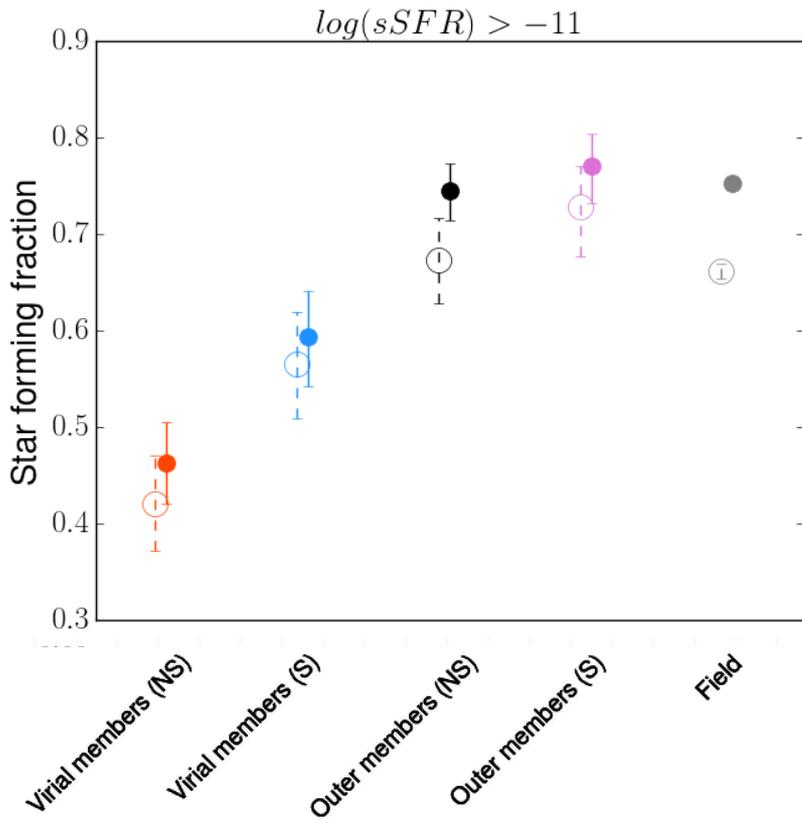

- 1) Build and characterize the galaxy population in the XXL-N field @  $0.1 \leq z \leq 0.5$  (three redshift bins).
- 2) The Galaxy environment at intermediate redshift and at different scales.
  - Field, Outer and Virial members.
  - Superclusters from Adami et al. 2017.
- 3) Zooming in on the galaxy population to study the star formation activity and properties and ages.
  - Full spectral fitting for deriving star formation properties and ages.
- 4) The star forming fractions and SFR-mass relation from  $z=0.1$  up to  $z=0.5$ .

# The SF fraction and the SFR-Mass relation at $0.2 \leq z < 0.3$

- Similar trends using rest-frame colours
- No dependence on X-ray luminosity

# The SF fraction and the SFR-Mass relation at $0.2 \leq z < 0.3$

- Similar trends using rest-frame colours
- No dependence on X-ray luminosity

- **sSFR-Mass varies with environment.**

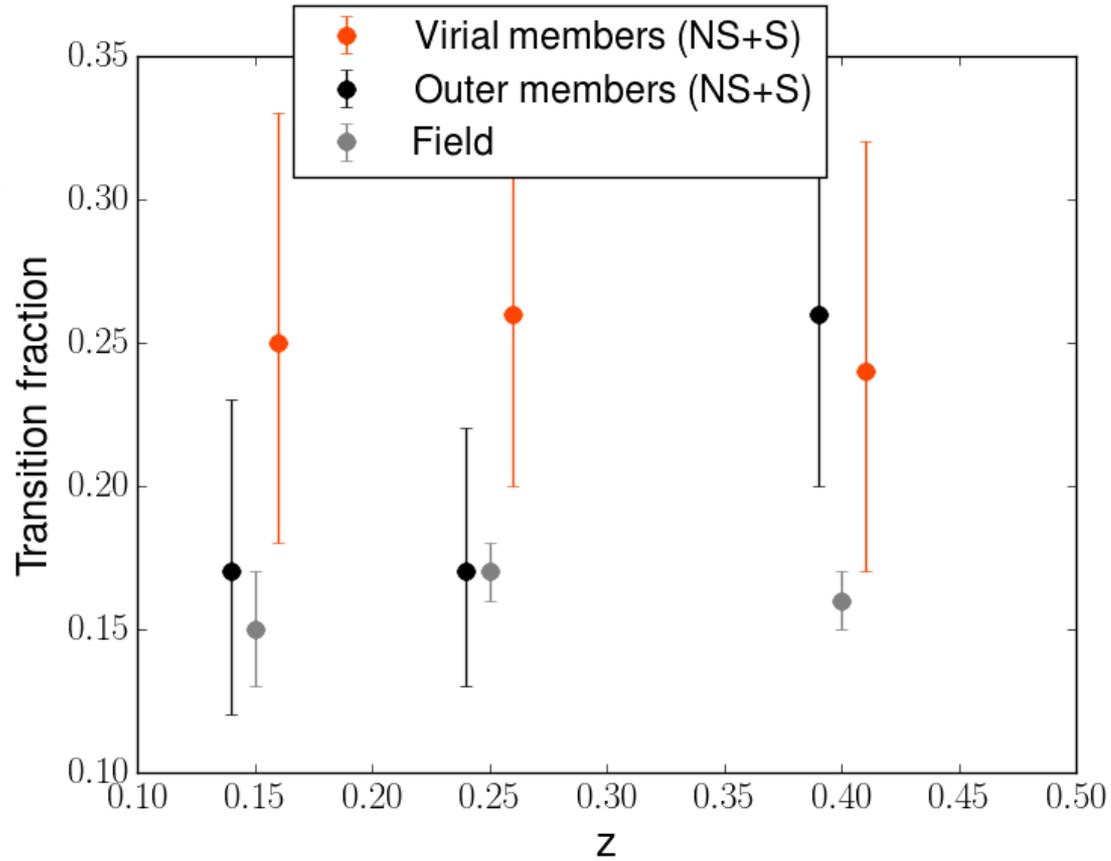

- **Transition galaxies:**

**Field: 17%**

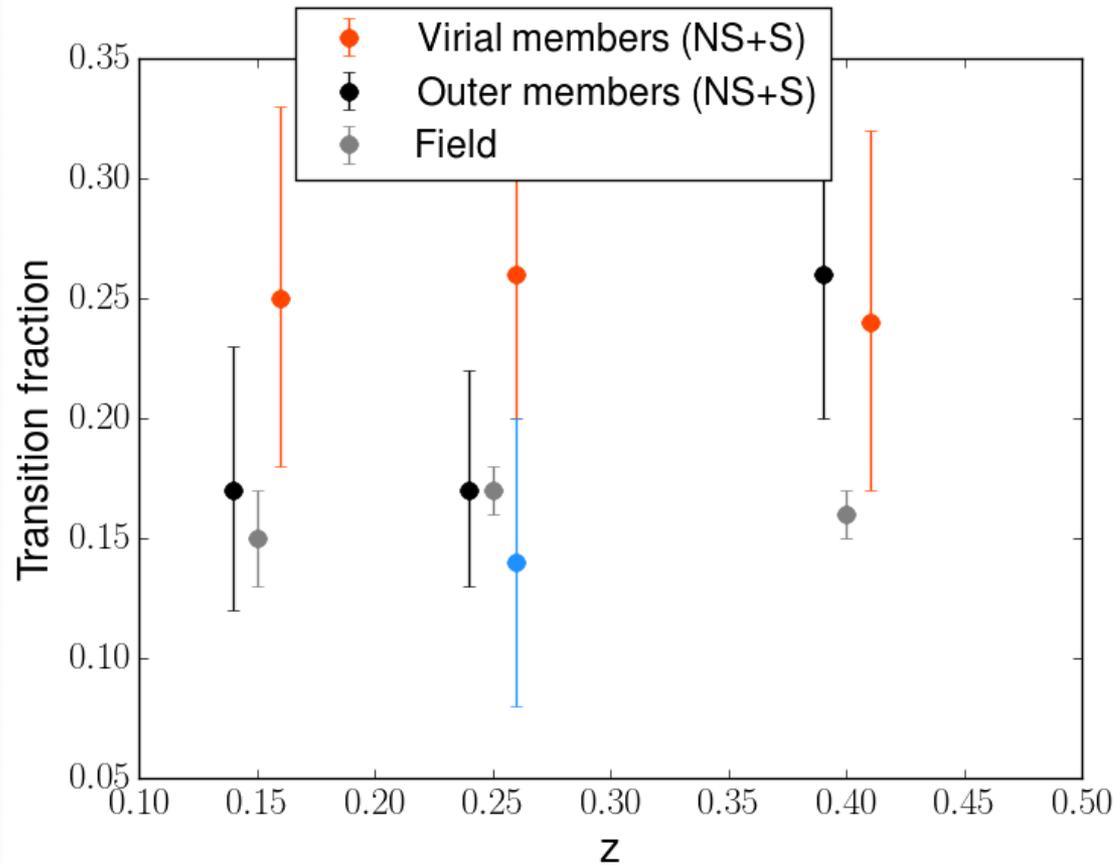

**Virial Members: 30% (19% in S)**

**Outer Members: 18% (10% in S)**

# Transition fractions from $z=0.5$ down to $z=0.1$

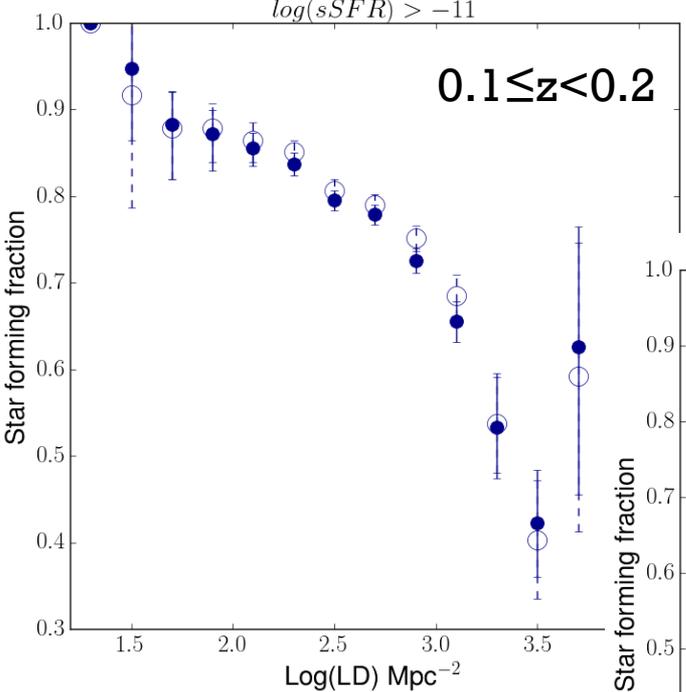

# Transition fractions from $z=0.5$ down to $z=0.1$

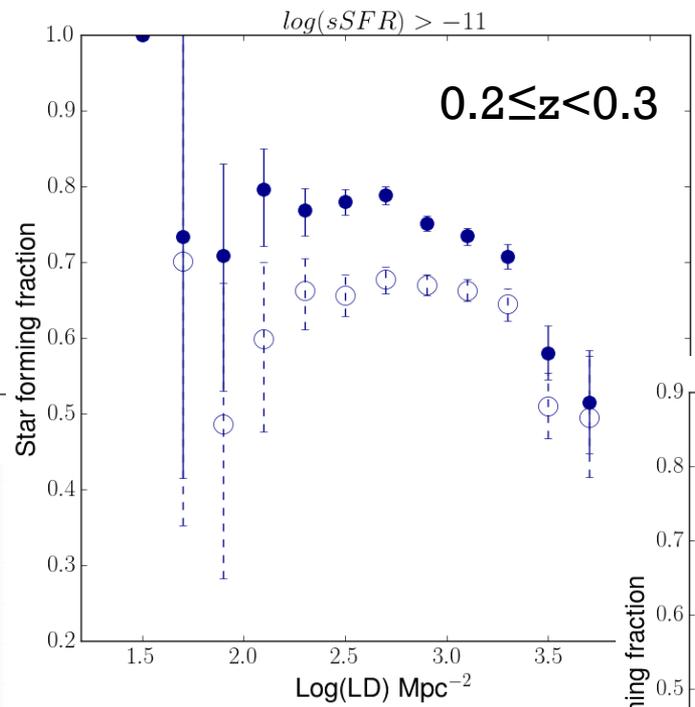

● Superclusters @  $0.2 \leq z < 0.3$  have the lowest fraction of transition galaxies ever.

# Local environment: SF and transition fractions from $z=0.5$ down to $z=0.1$

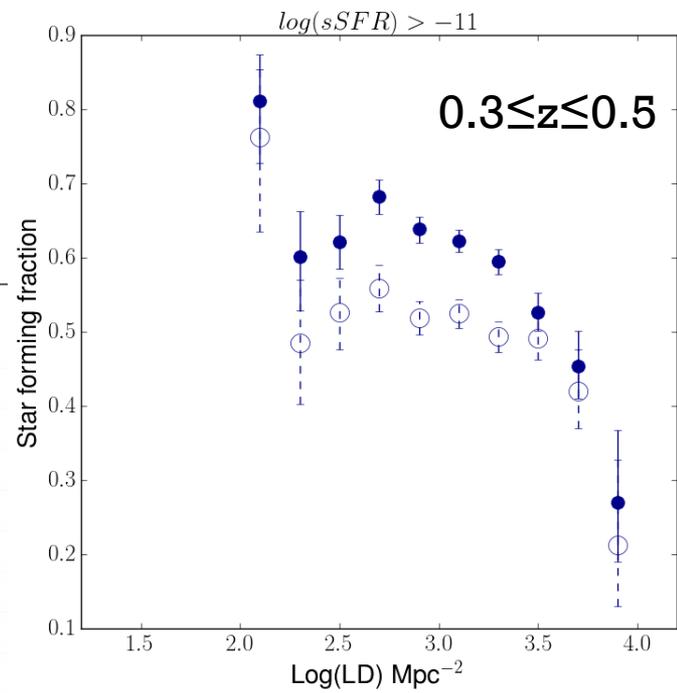

HD:  $F_{\text{transition}} = 0.16 \pm 0.02$   
 LD:  $F_{\text{transition}} = 0.17 \pm 0.02$

HD:  $F_{\text{transition}} = 0.17 \pm 0.02$   
 LD:  $F_{\text{transition}} = 0.16 \pm 0.02$

HD:  $F_{\text{transition}} = 0.18 \pm 0.03$   
 LD:  $F_{\text{transition}} = 0.17 \pm 0.03$

# CONCLUSIONS

- ✓ No significant influence of environment-dependent processes on GSMF in the mass range we are sampling.
- ✓ The fraction of star forming/blue galaxies is lower in cluster virial members than in all other environments at all redshifts (Wetzel et al. 2012 @low-z). **Differences are smoothed at high stellar masses.**
- ✓ The SFR-mass relation is environment dependent: both the **relation** and the number of **galaxies in transition** increase in the virial regions of G&C with respect to the field at all redshifts, and is maintained nearly constant across epochs.
- ✓ The **XLSSsC N01 supercluster** is an **exception** both in the sSFR-mass relation and in the fraction of transitions.
- ✓ In XLSSsC N01 passive galaxies in clusters have lower LW-ages as a result of the recent truncation of their SF-activity in cluster environment.
- ✓ Study the ages, the star formation history, the mass assembly history of galaxies as a function of *global* and *local* environment (see also Guglielmo et al. 2015).
