# Conclusions

- The LMC HI disk shows evidence of truncation by ram pressure stripping in the direction of motion ( $r_{\text{trunc}} = 6.2 \pm 0.25$  kpc)
- Maximal truncation occurs at pericenter, where LMC orbital properties are well known.
- This provides a direct constraint on the gas density of the MW's CGM at  $\sim 48$  kpc

$$n_{\text{MWHalo}}(R = 48.2 \pm 2.5 \text{ kpc}) = 1.1_{-.45}^{+.44} \times 10^{-4} \text{ cm}^{-3}$$
