

# Radio galaxies and their environment at $1 < z < 2$ (and beyond...)

Joël Vernet (ESO)

Carlos De Breuck, Audrey Galametz, Jack Mayo, Dan Stern,  
Nick Seymour, and the SHizRaG team

# Radio galaxies and their environment at $1 < z < 2$ (and beyond...)

Joël Vernet (ESO)

Carlos De Breuck, **Audrey Galametz**, **Jack Mayo**, Dan Stern,  
Nick Seymour, and the SHizRaG team

# Why around RG?

— Among the largest, most luminous, most massive galaxies at every epoch

— Progenitors of gE and cD

— Exist from  $z=0$  to  $z>5$

# Environment of High Redshift Radio Galaxies

## Narrow line emitters searches

(narrow band imaging+spectroscopic confirmation, led by G. Miley and coll.)

**Pros:** redshifts is known, little contamination from interlopers

**Cons:** samples only a small fraction of the total mass of the proto-cluster

Much less done on search for evolved (red sequence) galaxies around RGs

Ex: The SpiderWeb galaxy

The most studied protocluster at  $z > 2$

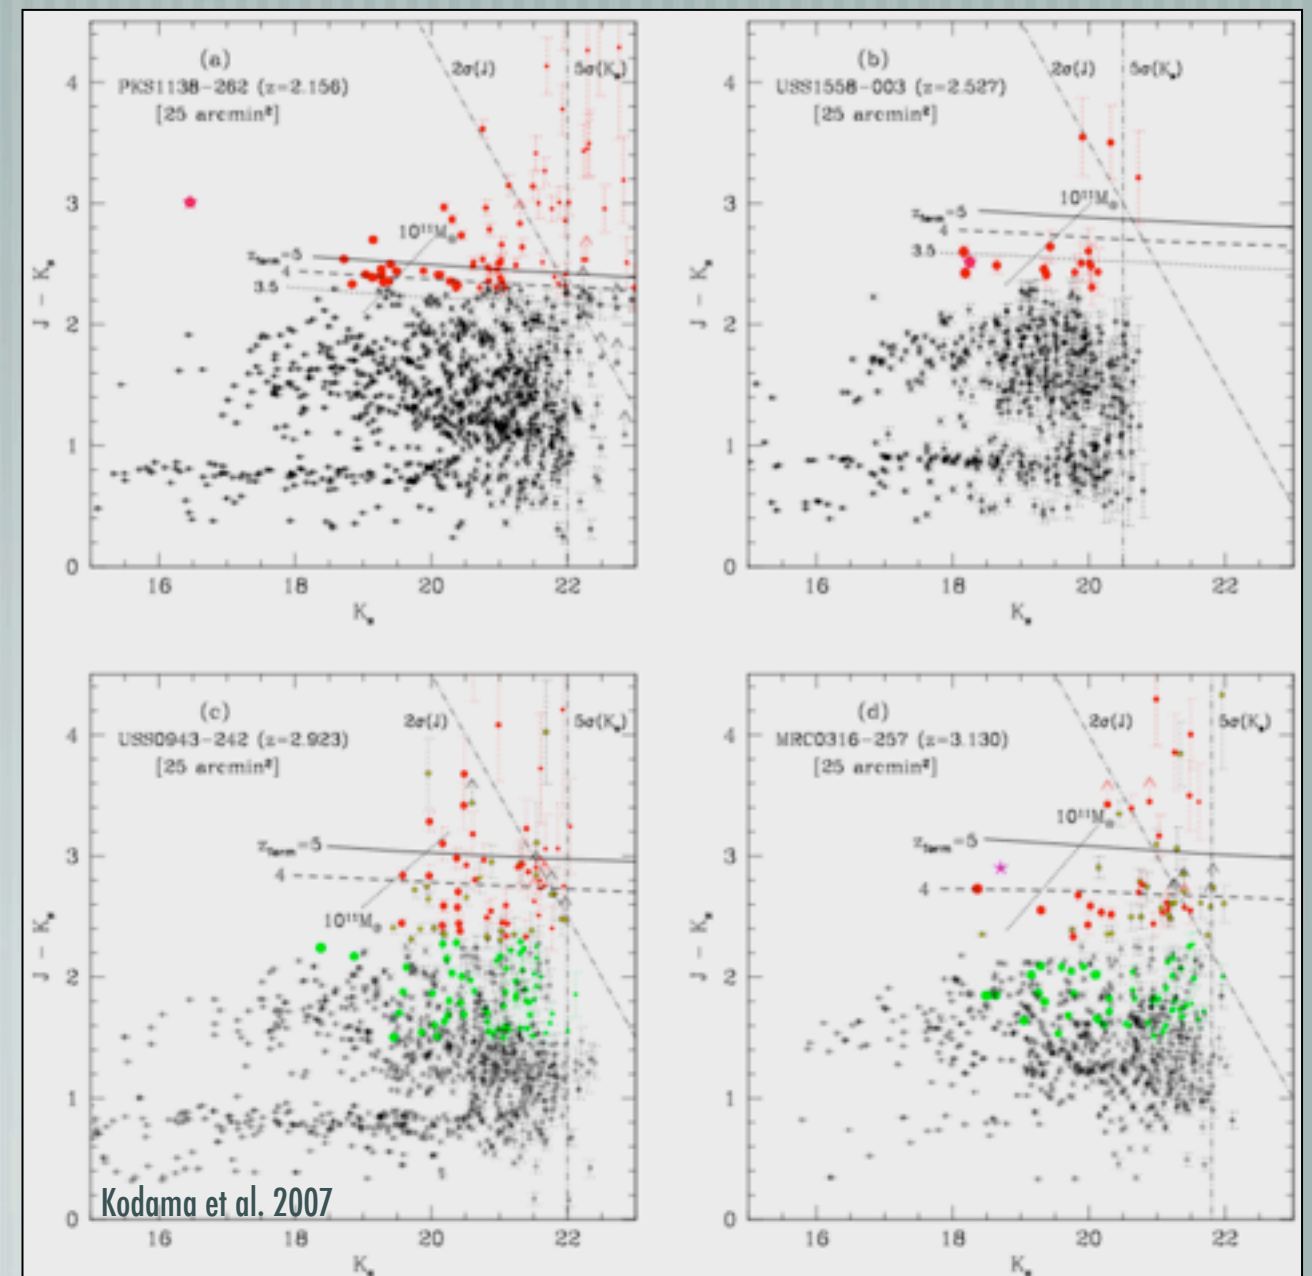

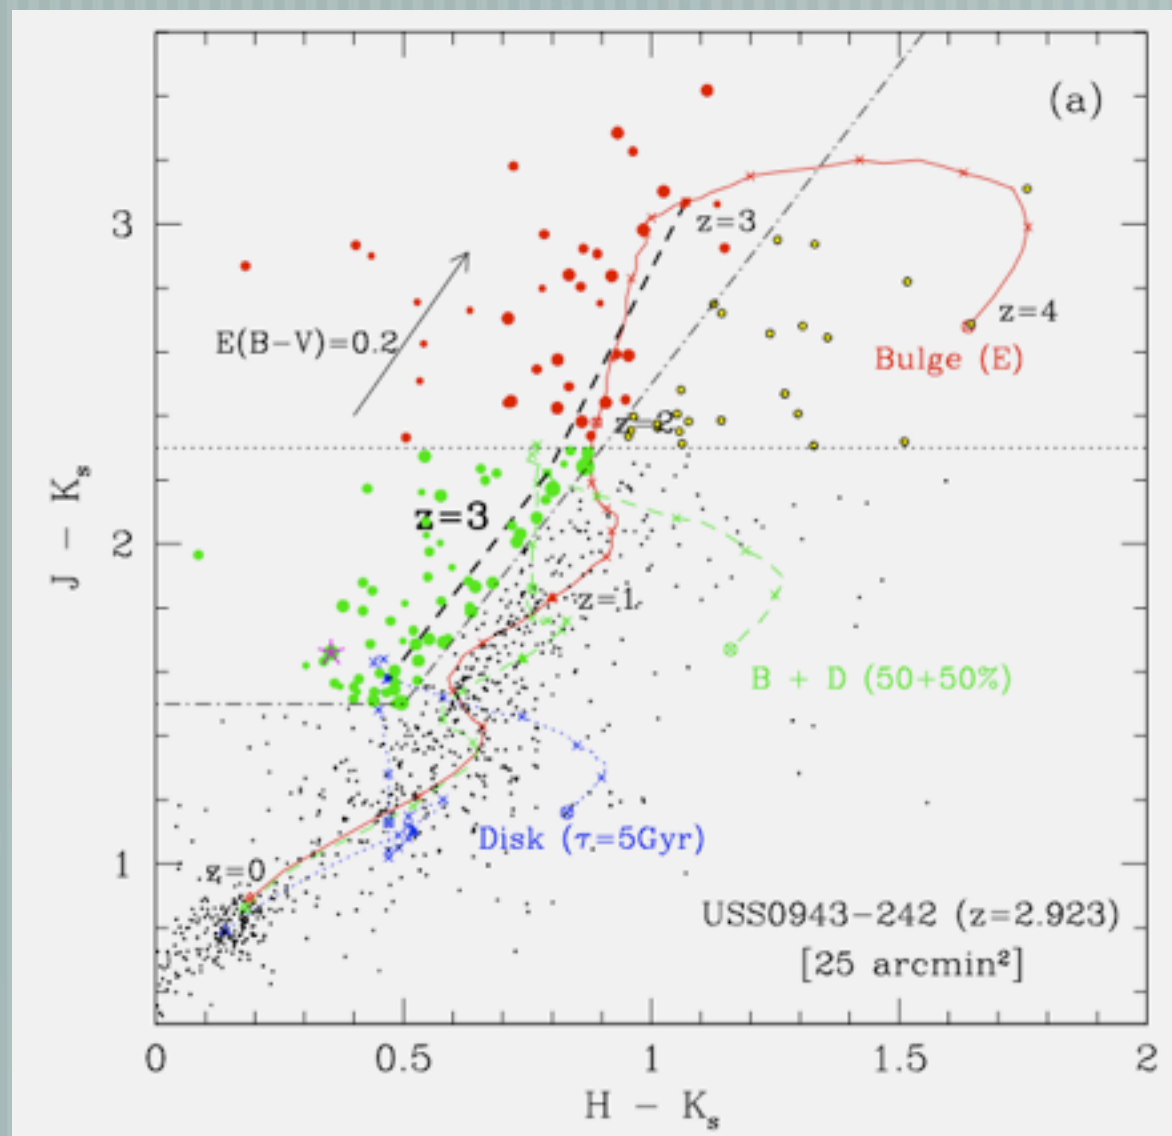

$\text{Ly}\alpha$  and  $\text{H}\alpha$  emitters, EROs, Lyman break galaxies  
... And now massive red cluster members

# Environment of High Redshift Radio Galaxies

Near infrared imaging + colour criteria (eg.  $J-K > 2.3$ ) to select more massive components that would populate the **red sequence**

Kodama et al. 2007, see also Zirm et al 2007

# The sample

Cover the radio luminosity - redshift plane as uniformly as possible in the range  $1 < z < 4$ , covering two orders of magnitude in radio luminosity

Sample chosen to maximize number of supporting observations without biasing

Optical/near-IR imaging and spectroscopy+polarimetry

Spitzer (3.6, 4.5, 5.8, 8.0, 16 and 24  $\mu\text{m}$ )

Herschel (70/100, 160, 250, 350 and 500  $\mu\text{m}$ )

Solid symbols - HzRGs in our Spitzer sample with IRAC/IRS imaging

Large circles - MIPS observations as well

Filled circles - HzRGs with HST data

Filled squares - HzRGs with SCUBA data

Plusses - parent sample of 225 HzRGs from which our sample of 70 was drawn

## Two Projects

CFHT / WIRCAM

VLT / Hawk-I

Sample of 10 HzRGs with  $1.7 < z < 2.5$ 

MRC 1017-220 ( $z=1.77$ )	MRC 0156-252 ( $z=2.02$ )
MRC 1324-262 ( $z=2.28$ )	USS 1425-148 ( $z=2.35$ )
MRC 0406-244 ( $z=2.43$ )	MG 2308+0336 ( $z=2.46$ )
MRC 2104-242 ( $z=2.49$ )	MRC 2139-292 ( $z=2.55$ )
MRC 0324-228 ( $z=1.89$ )	MRC 0350-279 ( $z=1.90$ )

Observed in YHK or JHK with HAWK-I to  
bracket the 4000Å break

## Two Projects

# Two Projects

## redshift 1.5

7C1756+6520 ( $z=1.416$ )

7C1751+6809 ( $z=1.54$ )

- Bb & z band – Palomar/LFC
- J & Ks bands – CFHT/WIRCam

Large scale (15'x15')

## redshift 2

MRC1017-220 ( $z=1.77$ )

MRC0156-252 ( $z=2.02$ )

- YHK bands – VLT/HAWK-I

Large scale (7.5'x7.5')

- Extraction of source catalogues
- Design of modified/new colour criteria
- Tests on colour criteria
- Selection of cluster member candidates
- Detection of overdensities / compare to large field surveys
- Color magnitude diagrams

# Color criteria

# Overdensities?

redshift 1.5

## Comparison with control fields

- GOODS-S field  
GOODS-MUSIC catalogue  
(Santini et al. 2009)
- MUSYC fields (Gawiser et al. 2006)
- 4 fields
- $\sim 1400$  sq. arcmin

No overdensity around 7C1751+6809

7C1756 - overdense in red galaxies (factor 2)  
- consistent in blue galaxies  
- within  $2'$ , overdense in red (factor 5)  
and blue galaxies (factor 2)

Also an overdensity of mid-IR selected AGN

# Overdensities?

redshift 1.5

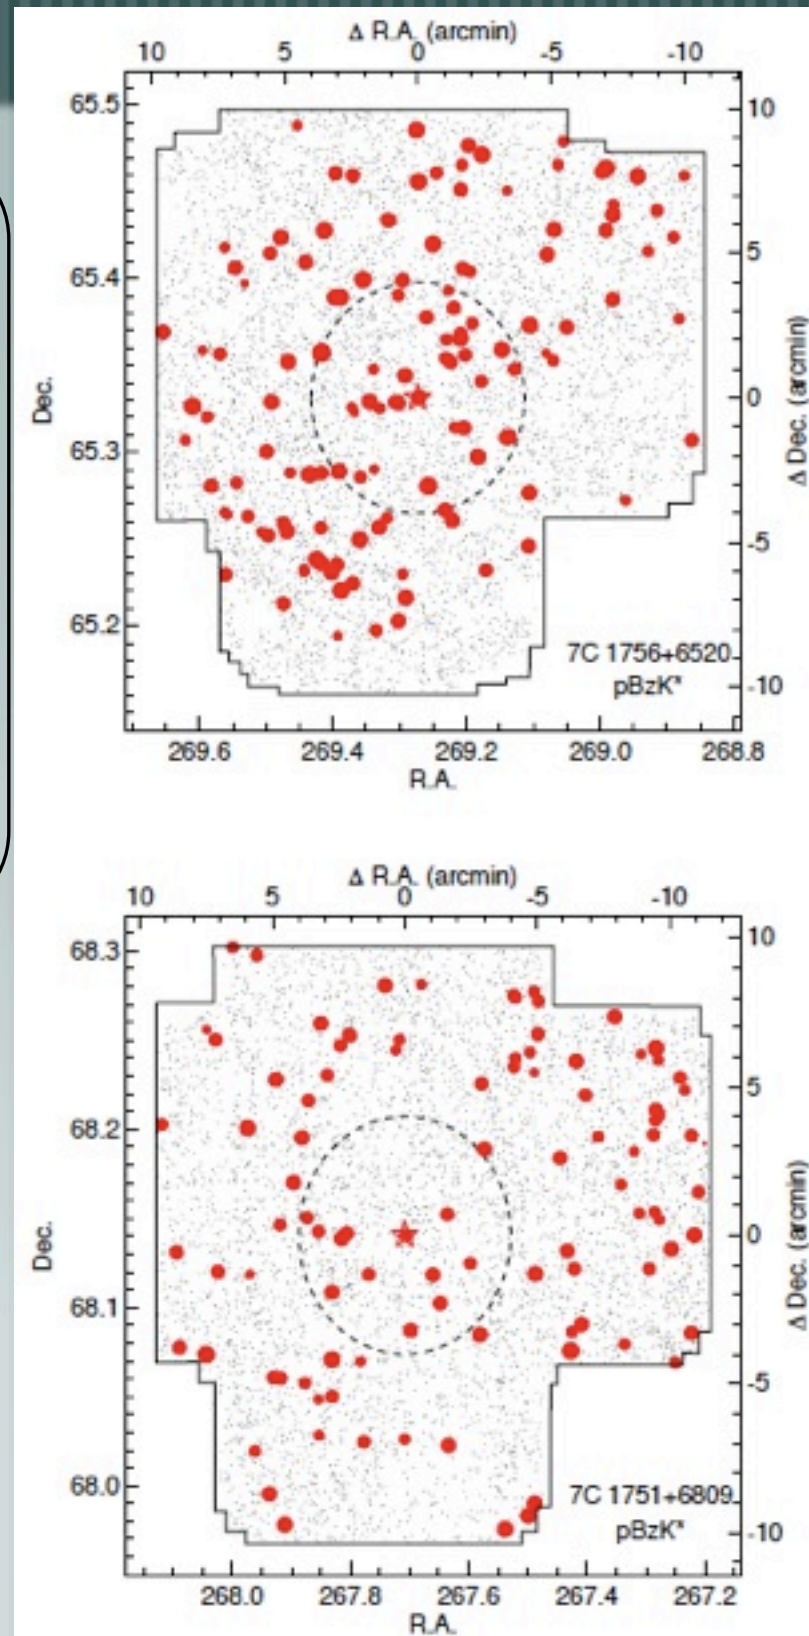

## Comparison with control fields

- GOODS-S field  
GOODS-MUSIC catalogue  
(Santini et al. 2009)
- MUSYC fields (Gawiser et al. 2006)  
4 fields
- $\sim 1400$  sq. arcmin

No overdensity around 7C1751+6809

7C1756 - overdense in red galaxies (factor 2)  
- consistent in blue galaxies  
- within  $2'$ , overdense in red (factor 5)  
and blue galaxies (factor 2)

Also an overdensity of mid-IR selected AGN

7C 1756

7C 1751

# Overdensities?

redshift 1.5

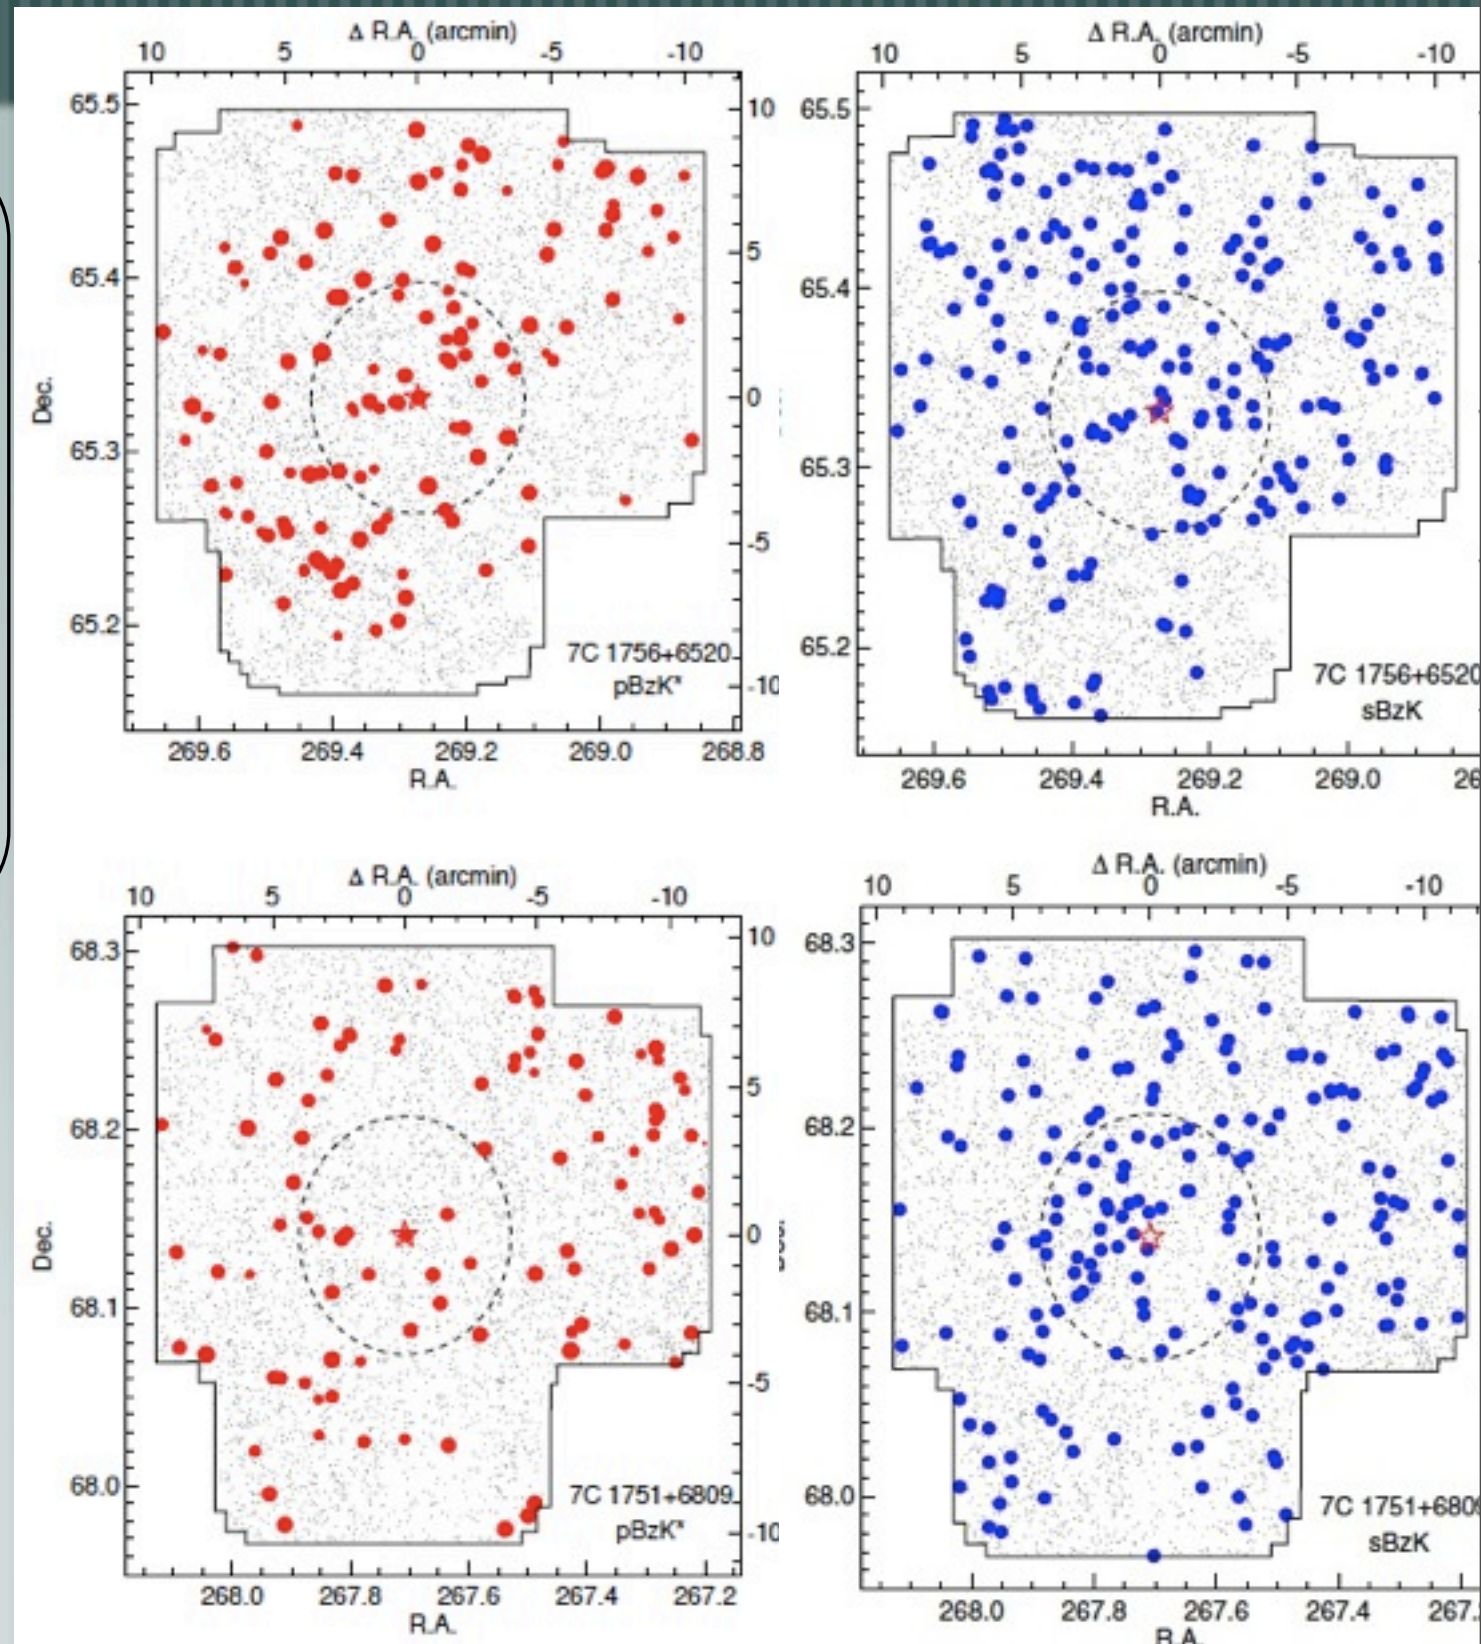

## Comparison with control fields

- GOODS-S field  
GOODS-MUSIC catalogue  
(Santini et al. 2009)
- MUSYC fields (Gawiser et al. 2006)  
4 fields  
~ 1400 sq. arcmin

No overdensity around 7C1751+6809

7C1756 - overdense in red galaxies (factor 2)  
- consistent in blue galaxies  
- within 2', overdense in red (factor 5)  
and blue galaxies (factor 2)

Also an overdensity of mid-IR selected AGN

# Overdensities?

redshift 2

## Comparison with control fields

- GOODS-S:
  - 2 HAWK-I pointings
- 1 Control field:
  - 1 HAWK-I pointing (CF)

A galaxy sheet at  $z=1.6$  in GOODS-S

Cl 0332-2742  
( $z=1.61$ )  
Kurk et al. 2009

Compact concentration of  
both red and blue sources  
within 1Mpc of MRC0156-252

# Overdensities?

redshift 2

## Comparison with control fields

- GOODS-S:  
2 HAWK-I pointings
- 1 Control field:  
1 HAWK-I pointing (CF)

No overdensity around MRC1017-220

MRC0156-252 - densest field in red galaxies  
(x3.2 1017 and x1.6 GOODS-S)

- Even denser at  $z < 2'$  (x3.9 with 1017)
- slightly denser in blue galaxies (x1.5-2)

Compact concentration of  
both red and blue sources  
within 1Mpc of MRC0156-252

# Color-magnitude diagrams

redshift 1.5

redshift 2

- Red galaxies colours consistent with red sequence models at  $z_f > 2$
- Truncation at  $K_{AB} > 21$

- Red galaxies colours consistent with red sequence models at  $z_f > 3$
- Structure similar to PKS1138-262

# Color-magnitude diagrams

redshift 1.5

redshift 2

- Red galaxies colours consistent with red sequence models at  $z_f > 2$
- Truncation at  $K_{AB} > 21$

- Red galaxies colours consistent with red sequence models at  $z_f > 3$
- Structure similar to PKS1138-262

# Spectroscopic confirmation of a $z=1.42$ cluster

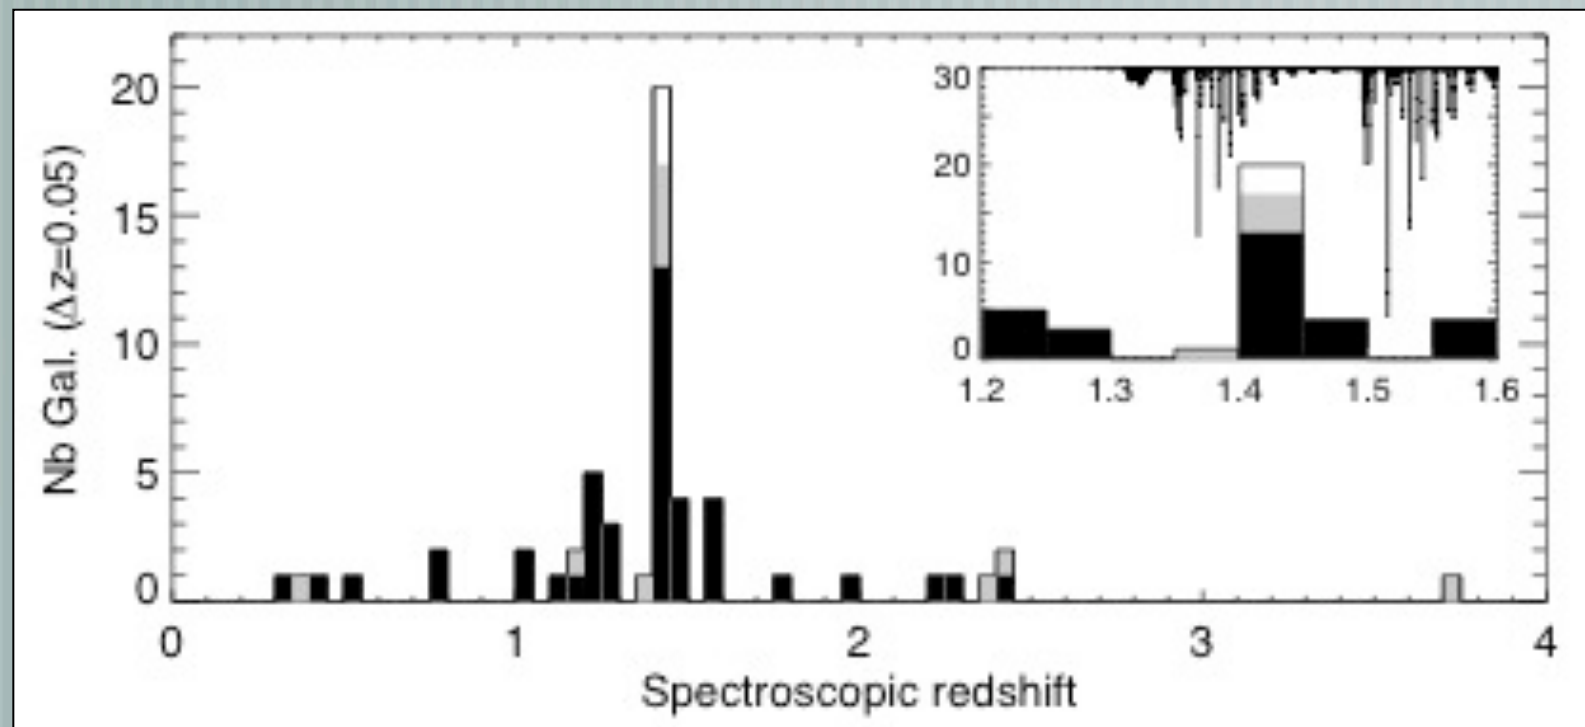

Galametz et al. 2010b

Follow-up of the overdensity around  
7C1756+6520 with Keck/Deimos

- 129 BzK galaxies: 82 sBzK & 47 pBzK\*
- 11 AGN candidates + 7C 1756+6520

Redshifts obtained for

- 36 sBzK
- 7 pBzK\*
- 9 AGN + 7C 1756+6520 ( $z=1.4156$ )

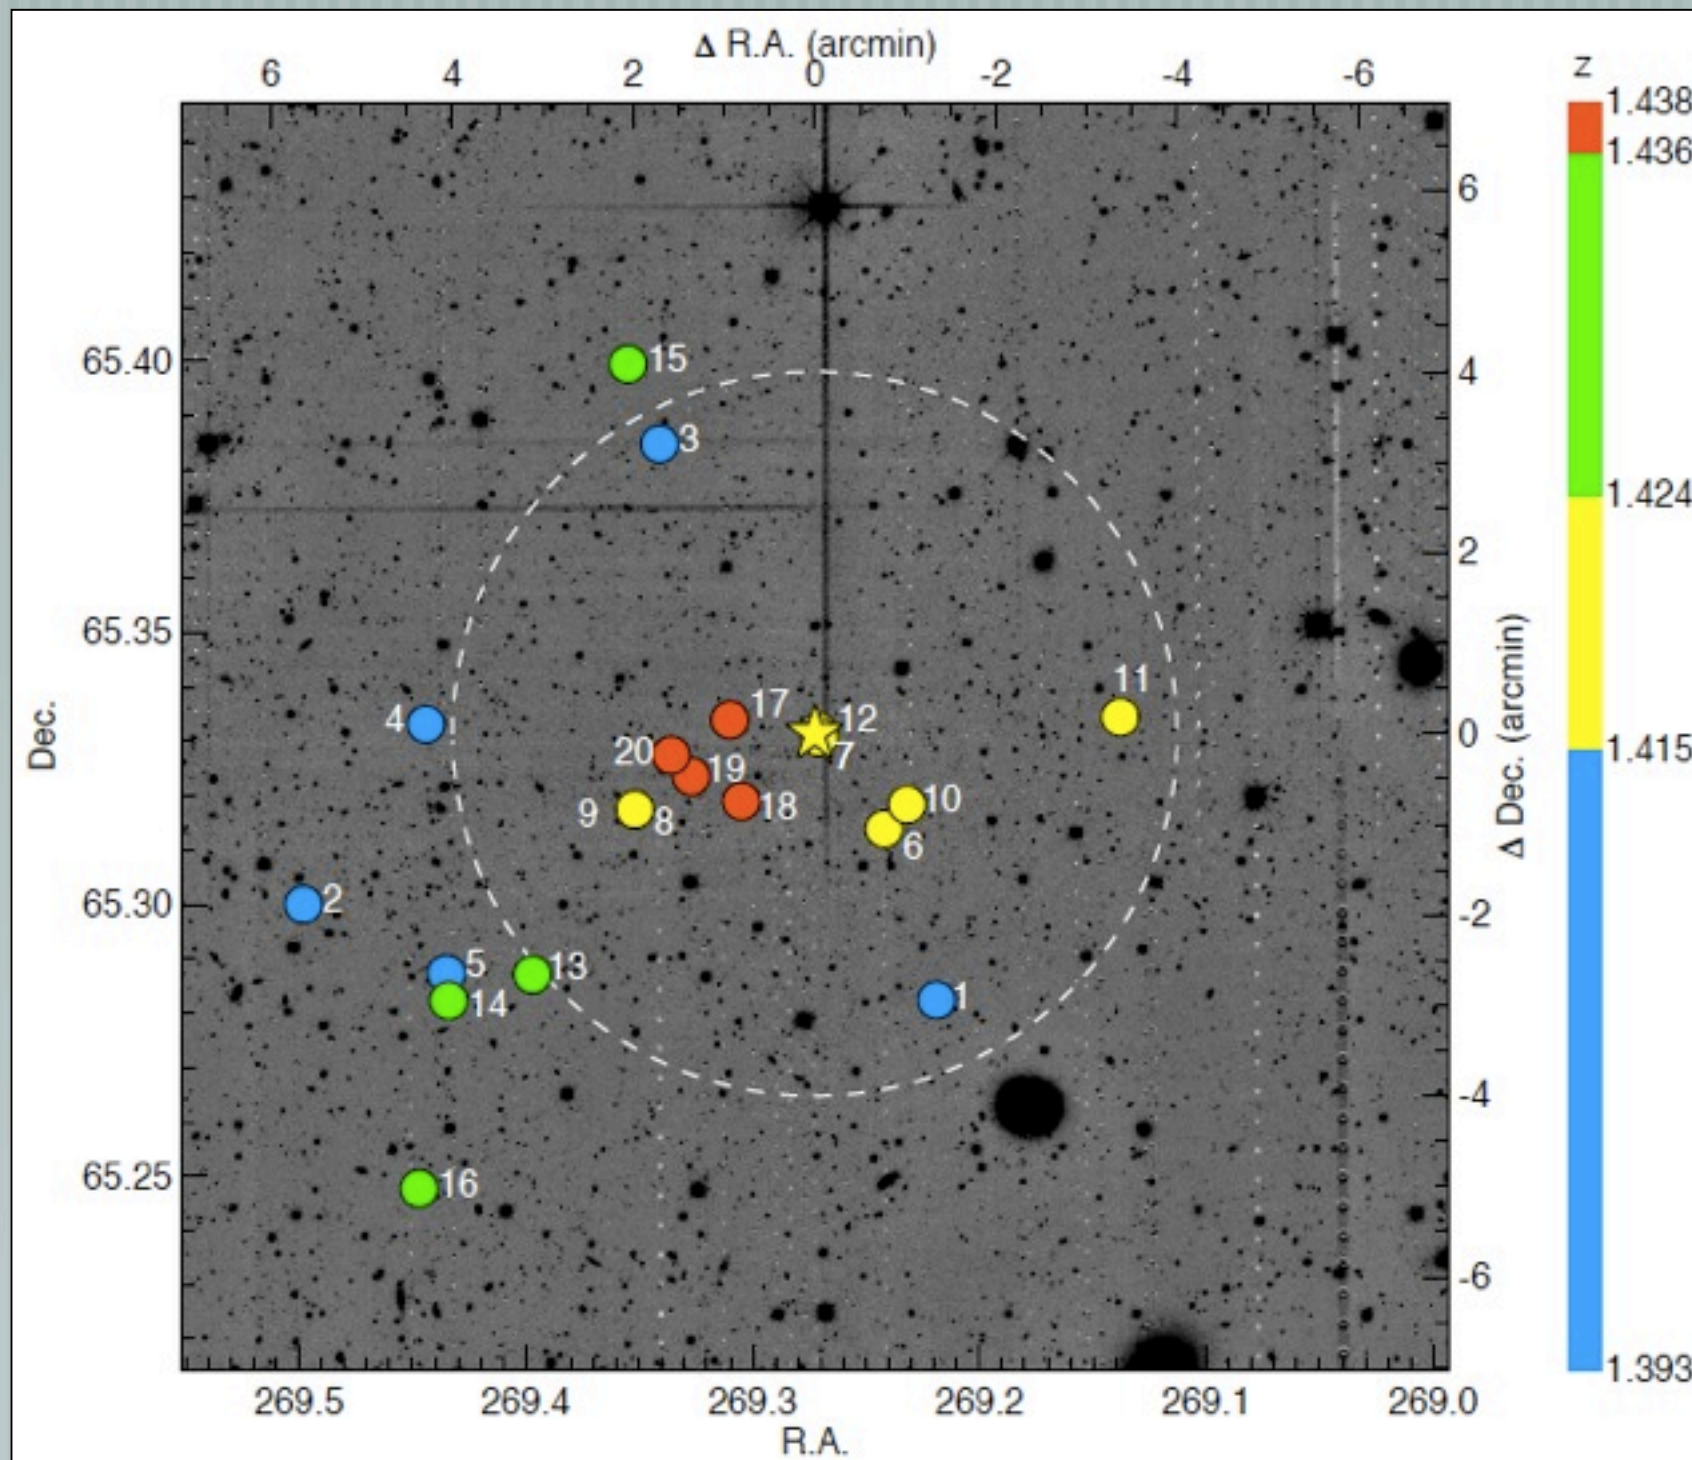

# Spectroscopic confirmation of a $z=1.42$ cluster

20 galaxies within  $\Delta v < 3000$  km/s:

- 10 sBzK galaxies
- 3 pBzK galaxies
- 4 AGN
- 3 serendipitous

# Spectroscopic confirmation of a $z=1.42$ cluster

# Now on the whole sample...

- [ Clear diversity. Some fields are overdense, others not...
- [ 2 studies on the whole sample:
  - IRAC Ch. 1 & 2
  - MIPS 24 $\mu$ m
- [ Comparison with SWIRE, shallow but a good match to our data
- [ Have a statistical measurement + identify good candidates

# The passive neighborhood

Galamez et al., submitted to ApJ

$3.6\mu\text{m}-4.5\mu\text{m} > -0.1$   
isolates galaxies at  $z > 1$

# The passive neighborhood

Galamez et al., submitted to ApJ

$3.6\mu\text{m}-4.5\mu\text{m} > -0.1$   
isolates galaxies at  $z > 1$

- Counts in cells
- Compare to wide area blank fields from SWIRE
- 11 fields  $> 2\text{sig}$  overdensity
- 6 of these were known overdensities, 5 new
- some targets with known overdensity of line emitters do not stand out here but...

# The active neighborhood

Mayo et al., in prep

At 24  $\mu\text{m}$

Active galaxies  
SF with PAHs &  
AGN thermal

- Cut to the same depth
- Count in 3'x3' cells
- Reference wide area blank fields from SWIRE

# Conclusions

- [ RG in general live in denser than average environment

- [ But this environment is very diverse:

- Example, 4c40.36 and PKS1138-262, about the same redshift (same selection effects), one is overdense in active objects, the other in passive ones

- An indication for some weak correlation with radio power (higher density of passive galaxies around more powerful galaxies)

- [ Any difference between Radio loud and radio quiet AGN neighborhood (CARLA project)?
